

JOINT TREATING METHOD

ABSTRACT OF THE DISCLOSURE

5 joint involves resecting at least one of the opposed joint
surfaces to expose a cancellous bone surface. A bioresorbable
implant is mounted to one of the joint surfaces so that the
resected joint surface rubs against the surface of the
10 fibrocartilage at the resected bone surface as the implant is
resorbed thereby effectively replacing the implant with
fibrocartilage during such resorption.
